CLAIMS

What is claimed is:

1	1.	A method for manufacturing a magnetic write element for use in a data
2		recording system, comprising the steps of:
3		a. providing a first pole having a first and a second end and constructed of a magnetic material;
5 6		b. depositing a dielectric write gap material layer over said first pole, said dielectric write gap material layer extending to said first end of said first
7		pole and being formed so as to leave a portion said first pole uncovered at said second end of said first pole to provide a back-gap;
9		c. depositing a mask material onto said seed layer;
10 11		d. patterning a coil pattern in said mask material using a photolithographic process;
12 13		e. selectively removing a portion of said patterned mask material to produce a recess in said mask material in said pattern of said coil;
14 15		f. forming a trench in said mask material adjacent said coil pattern, said trench having a depth that is shallower than that of said coil pattern recess;
16		g. baking said mask material;
17		h. depositing an electrically conductive coil into said coil pattern recess;
18		i. removing said mask material;
19		j. depositing a coil insulation layer;
20		k. curing said coil insulation layer; and
21		1. forming a second pole constructed of a magnetic material, said second
22		pole contacting said first pole at said back-gap, and being separated from
23		said first pole at said first end by said write gap material layer.

2

2. A method as recited in claim 1 wherein said electrically conductive coil is 1 2 electroplated and further comprising the steps of: a. before depositing said mask material, depositing a thin, electrically 3 4 conductive seed layer; 5 b. after depositing said electrically conductive coil, removing said seed layer. A method as recited in claim 1 wherein said coil material and said seed layer 1 3. 2 are copper. 4. A method as recited in claim 1 wherein said trench extends around said coil 1 2 patterned recess in said mask. A method as recited in claim 1 further comprising two or more of said 1 5. 2 trenches. 6. A method as recited in claim 1 wherein said trench has a width of 0.3 to 0.5 1 2 microns. 7. A method as recited in claim 5 wherein said trenches are spaced roughly 0.5 1 2 microns apart. 1 8. A method as recited in claim 1 wherein said trench is spaced at least 0.8 2 microns from the outermost portion of said coil patterned recess in said mask material. 3 1 9. A method as recited in claim 1 wherein said coil has a pitch of at least 0.4

microns.

1 10. A method as recited in claim 1 wherein said coil patterned recess in said mask
2 material extends through said mask material, and wherein said trench does not
3 extend through said mask material.

1 1.h. 2 7 1.h. 2

A magnetic write element constructed according to the process of claims 1, 2, 3, 4, 5, 6, 7, 8, 9, or 10.

- 12. A data storage and retrieval system for use with a computer, the system comprising:
- 3 MO

10

11

- a. a housing;
- b. a motor connected with said housing;
- 5 c. a spindle driven by said motor;
 - d. a magnetic disk, support by said spindle for rotation thereabout;
 - e. an actuator connected with said housing;
 - f. a head supported by said actuator proximal to a surface of said disk;
 - g. a magnetic read element disposed on said head;
 - h. a magnetic write element disposed on said head, said write element being constructed by the method of claims 1, 2, 3, 4, 5, 6, 7, 8, 9, or 10.
